Industrial DC/DC CONVERTER MGDI-100 Wide Input : 100W POWER

# 4:1 & 5:1 Wide Input Single Output Metallic Case - 1 500 VDC Isolation

- Wide input range
- Nominal power up to 100 W
- High efficiency (typ. 88%)
- Soft start
- Galvanic isolation 1.500 VDC according to EN 60950
- Integrated LC input filter
- Permanent short circuit protection
- External synchronisation
- External trim and sense adjustment : -20/+10%
- No optocoupler for high reliability
- RoHS process

#### 1-General

The MGDI-100 wide input series is a full family of DC/DC power modules designed for use in distributed power architecture where variable input voltage and transient are prevalent making them ideal particularly for transportation, railways or high-end industrial applications. These modules use a high frequency fixed swiching topology at 260KHz providing excellent reliability, low noise characteristics and high power density. Standard models are available with wide input voltage range of 14-55 and 36-140 volts for 24/36/72/110V batteries. The serie includes single output voltage choices of 2.5, 3.3, 5, 12, 15 and 26 volts (for 24Vdc applications).

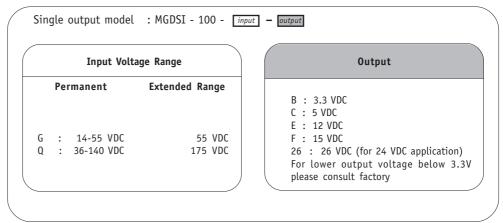

Industrial Grade

The MGDI-100 serie is designed in conformity withsafety standards EN60950 and UL1950. All the modules are designed with LC network filters to minimize reflected input current ripple and output voltage ripple according to ease EN55022 and FCC Part 15J standard.

The modules include a soft-start, an input undervoltage and overvoltage lock-out, a permanent short circuit protection and a thermal protection to ensure efficient module protections. The soft-start allows current limitation and eliminates inrush current during start-up. The short circuit protection completely protects the modules against short-circuits of any duration by a shut-down and restores to normal when the overload is removed.

Note (1) : A 47K0hm resistance need to be connected accross pins Gin and UVLO (see section 12-1)

Note \*: These performances are measured with the sense line connected. Note \*: It is recommended to mount the converter on a heatsink for this test, see section 10 for further details. Note \*\*\*: The ripple output voltage is the periodic AC component imposed on the output voltage, an aperiodic and random component (noise) has also to be considered. This noise can be reduced by adding 1 external decoupling capacitor connected between Gin and Gout. These capacitance should be layed-out as close as possible from the converter. The ripple output voltage is measured by connecting a ceramic chip capacitor Co accross Vo and Go pins (C=100µF if Vo<5Vdc C=10µF if Vo>5Vdc)

# 8- Electromagnetic Interference

 $\label{eq:electromagnetic interference requirements according to EN55022 \ class \ A \ and \ class \ B \ can \ be \ easily \ achieved \ as \ indicated \ in \ the \ following \ table \ :$ 

| Electromagnetic Interference according to EN55022 |                         |  |  |  |
|---|-------------------------|--|--|--|
| Conducted<br>noise                                | Configuration<br>Models | With 4 common mode capacitors C $_{c}$ = 10nF and external filter  |  |  |
| emission  | All models              | Class A  |  |  |
| Radiated<br>noise                                 | Configuration<br>Models | With 4 common mode capacitors C $_{c}$ = 10 nF and external filter |  |  |
| emission  | All models              | Class B  |  |  |

#### 8-1 Module Compliance with EN55022 class A/class B Standard

Electromagnetic interference requirements according to EN55022 class A or class B can be easily achieved by adding an external common mode noise capacitance ( $C_c = 10nF/rated$  voltage depending on isolation

requirement) and an external filter. The common mode noise capacitance C\_ should be layed-out as close as possible from the DC/DC converter. Please consult factory for details.

\* Note : Value of common mode noise capacitance depends on isolation requirements (typically 10nF/1500V or 10nF/3000V). In case of dielectric strengh test in AC mode, adapt the capacitance value in order to be compatible with maximum admissible leakage current.

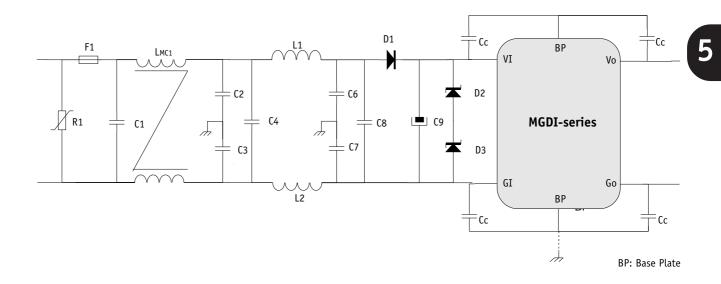

# 9- Surge Susceptibility EN61000-4-5 & EN50155

Surge susceptibility requirements according to EN50155, EN61000-4-5 and electromagnetic interference requirements of EN55022 class A can easily be achieved using :

• an input limitor filter : schematics of discret components, to sustain the following surge levels :

| Characteristics | Standards    | Levels  |
|-----------------|--------------|---|
| Spikes          | EN 61000-4-5 | Level 4 with 4 000 V waveform 50 $\mu s,$ impedance 2 0hm   |
| Line to line    | EN 50155     | Level 1 800 V waveform 50 µs, impedance 100 and 5 0hm<br>Level 8 400 V waveform 0.1 µs, impedance 100 0hm |
| Spikes          | EN 61000-4-5 | Level 4 with 4 000 V waveform 50 $\mu s,$ impedance 12 0hm  |
| Line to earth   | EN 50155     | Level 1 800 V waveform 50 µs, impedance 100 and 5 0hm<br>Level 8 400 V waveform 0.1 µs, impedance 100 0hm |

The input limitor filter schematics is given below, please consult design note «Surge filter recommendations for 50W up to 200W modules for details and components description.

# **10- Thermal Characteristics**

| Thermal resistance                               | Rth case to ambient in free air natural convection | Typical            | 6°C /W                        |

The following discussion will help designer to determine the thermal characteristics and the operating temperature.

Heat can be removed from the baseplate via three basic mechanisms :

• Radiation transfert : radiation is counting for less than 5% of total heat transfert in majority of case, for this reason the presence of radient cooling is used as a safety margin and is not considered.

• Conduction transfert : in most of the applications, heat will be conducted from the baseplate into an attached heatsink or heat conducting member; heat is conducted thru the interface.

• Convection transfert : convecting heat transfer into air refers to still air or forced air cooling.

In majority of the applications, we will consider that heat will be removed from the baseplate either with :

- heatsink,
- forced air cooling,
- both heatsink and forced air cooling.

To calculate the maximum admissible ambient temperature the following method can be used.

Knowing the power used Pout and the efficiency  $\eta\colon$ 

• determine the power dissipated by the module Pdiss that should be evacuated :

Pdiss = Pout
$$(1/\eta - 1)$$
 (A)

 then determine the thermal dissipation : Tdiss = Rth(b-a) x Pdiss (B)

where Rth(b-a) is the thermal resistance from the baseplate to ambient.

This thermal Rth(b-a) resistance is the summ of :

• the thermal resistance of baseplate to heatsink (Rth(b-h)). The interface between baseplate and heatsink can be nothing or a conducting member, a thermal compound, a thermal pad.... The value of Rth(b-h) can range from 0.4°C/W for no interface down to 0.1°C/W for a thermal conductive member interface.

5

• the thermal resistance of heatsink to ambient air (Rth(h-a)), which is depending of air flow and given by heatsink supplier.

| Heat transfert     | Thermal resistance<br>heatsink to air Rth(h-a) |          | Thermal resistance<br>baseplate to heatsink Rth(b-h) | Global<br>resistance |
|--------------------|--|----------|--|----------------------|
| Free air cooling   | No Heatsink baseplate only :                   | 6°C/W    | No need of thermal pad                               | 6°C/W                |
| only               | Heatsink Aavid Thermalloy 824353B03250         | 3,9°C/W  | Bergquist Silpad* : 0,13°C/W                         | 4,03°C/W             |
| Forced air cooling | No Heatsink baseplate only :                   | 3,8°C/W  | No need of thermal pad                               | 3,8°C/W              |

| Forced air cooling | No Heatsink baseplate only :                   | 1,54°C/W | No need of thermal pad                               | 1,54°C/W             |
| 1000 LFM           | Heatsink Aavid Thermalloy 824353B03250         | 1°C/W    | Bergquist Silpad* : 0,13°C/W                         | 1,13°C/W             |

The table hereafter gives some example of thermal resistance for different heat transfert configurations.

Aavid Thermalloy is a heasink manufacturers. «Silpad» © is a registered trademark of Bergquist.

Note\* : Silpad performance are for Silpad 400 with pressure conditions of 50 Psi.

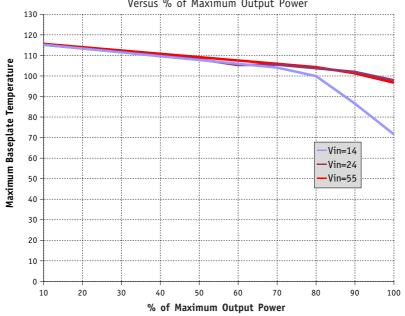

# 10- Thermal Characteristics (continued)

The two formulas (A) and (B) described in previous page :

- Pdiss = Pout $(1/\eta 1)$  (A)
- Tdiss = Rth(b-a) x Pdiss (B)

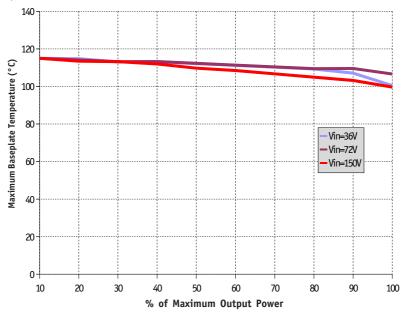

conduct to determine the maximum ambient temperature admissible as a function of the maximum baseplate temperature of the module.

Knowing the maximum baseplate temparature  ${\sf Tmax}_{\sf baseplate}$  the maximum ambient temperature is given by the following formula :

MGDI-100-G-x Series Maximum Baseplate Temperature Versus % of Maximum Output Power

MGDI-100-Q-x Series Maximum Baseplate Temperature Versus % of Maximum Output Power

# **11- Environmental Qualifications**

The modules have been subjected to the following environmental qualifications.

| Characteristics                                | Conditions   | Severity   | Test procedure                               |

## 12- Description of Protections

The MGDI-100 series include 5 types of protection devices.

# 12-1 Input Undervoltage Lockout (UVLO) and Overvoltage Lockout (OVLO)

#### 12-1-1 Undervoltage Lockout (UVLO)

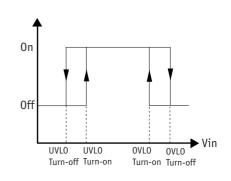

An input undervoltage protection will inhibit the module when input voltage drops below the lock-out turn-off threshold (see section 3 for value) and restores to normal operation automatically when the input voltage rises the lock-out turnon threshold.

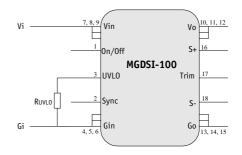

The input undervoltage lock-out threshold (UVLO) can be trimmed up by connecting a resistor between UVLO anf Gi pins. This resistance can be calculated as folow :

| F | R <sub>UVLO</sub> = | = <u>a x (1 + b</u><br>(n - 1 |              | here n = $\frac{UVLO}{UVLO}_{trim}$ |
|---|---------------------|-------------------------------|--------------|-------------------------------------|
|   |                     | Input G                       | ,<br>Input Q | threshold                           |
|   | а                   | NA                            | 1000         |                                     |
|   | b                   | NA                            | 6.55         |                                     |

#### 12-1-2 Overvoltage Lockout (OVLO)

An input overvoltage protection will inhibit the module when input voltage reaches the overvoltage lockout turn-off threshold (see section 3 for value) and restores to normal operation automatically when the input voltage drops below the overvoltage Lockout turn on threshold.

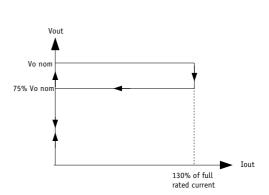

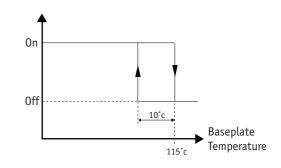

#### 12-2 Output Over Current Protection (OCP)

The MGDI-100 Series incorporates a straight line current limit and protection circuit. When the output current reaches 130% of it's full-rated current (Icurrent limit), the output voltage decreases down to 75% of nominal output voltage. Below this threshold the converter falls in hiccup mode by testing periodically if an overload is applied. The module restart automatically to normal operation when overcurrent is removed.

#### 12-3 Over Temperature Protection (OTP)

A thermal protection device adjusted at  $115^{\circ}C(+/-5\%)$  internal temperature with  $10^{\circ}C$  hysteresis cycle will inhibit the module as long as the overheat is present and restores to normal operation automatically when overheat is removed. The efficiency of the OTP function is warranty with the module mounted on a heatsink.

### **13- Description of Functions**

#### 13-1 Trim Function

The output voltage Vo may be trimmed in a range of 80%/110% of the nominal output voltage via a single external trimpot or fixed resistor.

#### **Trim Up Function**

Do not attempt to trim the module higher than 110% of nominal output voltage.

Also do not exceed the maximum rated output power when the module is trimmed up.

The trim up resistor must be connected to S+ pin.

The trim up resistance must be calculated with the following formula :

$$Ru = \frac{R1 \times (VO - Vref) \times VO_{nom}}{(VO - VO_{nom}) \times Vref} - R1 - R2$$

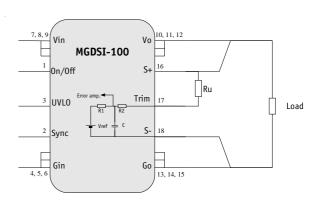

Do not trim down more than -20% of nominal output voltage otherwise the module may turn off.

The available output power is reduced by the same percentage that output voltage is trimmed down.

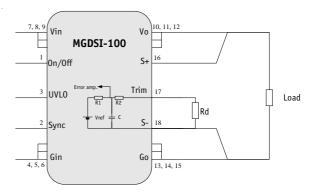

The trim down resistor must be connected to S- pin. The trim down resistance must be calculated with the following formula :

$$Rd = \frac{(R2 + R1) \times V0 - R2 \times V0}{V0_{nom}} - V0$$

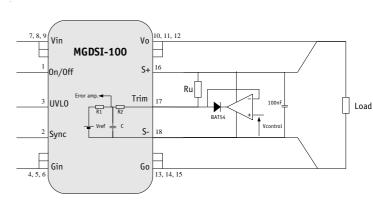

Industrial

Grade

#### Trim via a voltage

The output voltage is given by the following formula :  $V0 = \begin{bmatrix} 1 + \frac{R1}{(R1 + R2)} \times (\frac{Vcont}{Vref} - 1) \end{bmatrix} \times Vnom$ 

| Parameter           | Unit | Min. | Тур. | Max. |
|---------------------|------|------|------|------|
| Trim reference Vref | Vdc  | 2,45 | 2,5  | 2,55 |
| Resistor R1         | Ohm  | /    | 39K  | /    |
| Resistor R2         | Ohm  | /    | 270  | /    |
| Trim capacitor C    | nF   | /    | 10   | 1    |

# 13- Description of Functions (continued)

#### 13-2 Sense Function

If the load is separated from the output by any line lenght, some of these performance characteristics will be degraded at the load terminals by an amount proportional to the impedance of the load leads. Sense connections enable to compensate the line drop at a maximum of 10% of output voltage. Connection is described in figure herein.

#### 13-3 On/Off Function

The control pin 1 (0n/Off) can be used for applications requiring 0n/Off operation. This may be done with an open collector transistor, a switch, a relay or an optocoupler. Several converters may be disabled with a single switch by connecting all 0n/Off pins together.

- The converter is disabled by pulling low the pin 1.
- No connection or high impedance on pin 1 enables the  $_{\mathrm{On}_{j}}$  converter.

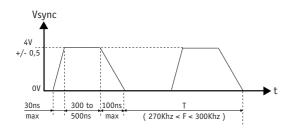

By releasing the On/Off function, the converter will restart within the start up time specifications given in table section 3

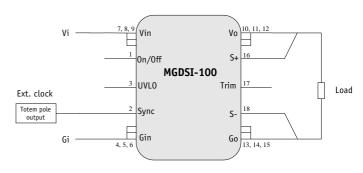

| Vi ——— | 7, 8, 9 | Vin<br>On/Off | Vo   |            |
|--------|---------|---------------|------|------------|
|        | 3       | MGDSI-100     | ſrim | 17 Load    |
| n/0ff\ | 2       | Sync          | S-   |            |
| Gi ——— | 4, 5, 6 | Gin           | Go   | 13, 14, 15 |

| Parameter                     | Unit | Min. | Тур. | Max. | Notes, conditions  |
|-------------------------------|------|------|------|------|--|
| On/Off module enable voltage  | Vdc  | 3.5  | /    | 5    | Open, the switch must not sink more than $100\mu\text{A}$        |
| On/Off module disable voltage | Vdc  | 0    | /    | 0.5  | The switch must be able to sink 1mA                              |
| 0n/0ff alarm level            | Vdc  | 0    | /    | 0.5  | OTP faulty module  |
| On/Off module enable delay    | ms   | /    | /    | 30   | The module restarts with the same delay after alarm mode removed |
| On/Off module disable delay   | μs   | /    | /    | 100  | Vi nominal, full load  |

#### **13-4 Synchronization Function**

An external clock with pulse signals can be used to lock one or more converters. The external clock signal should have a frequency range from 270KHz to 300KHz, a low level below 0,5V a high level of 4V (+/-0.5V), a rise time of 30 ns max., a fall time of 100ns max., and a pulse width of 300 to 500 ns. Several converters can be synchronized by connecting their Sync pin together.

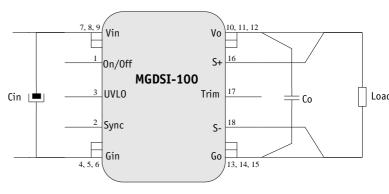

## **14- Application Notes**

#### 14-1 Input to Output Impedance

The MGDI-100 converters have been designed to be stable with no external capacitors when used in low inductance input and output circuits.

However, in many applications, the inductance associated with the distribution from the power source to the input of the converter can affect the stability of the converter. The addition of a  $\rm C_{in}{=}10\mu F$  electrolytic capacitor with an ESR < 1 0hm across the input helps ensure stability of the converter.

In many applications, the user has also to use decoupling capacitance at the load. The addition of a decoupling ceramic chip capacitor Co (Co=10 $\mu$ F if Vo>5Vdc or Co=100 $\mu$ F if Vo</=5Vdc) across the output and placed close to the converter allows to achieve the output voltage ripple specified in the table page 3.

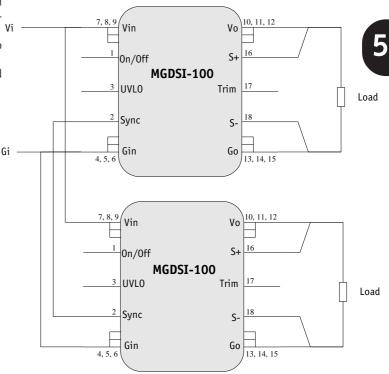

#### 14-2 Synchronization of Modules

The MGDI-100 series provides a synchronization function trough the pin 2 (Synchro) to enable automatic synchronisation between several converters.

If several converters are used, they lock themselves into the highest switching frequency.

The synchronization signal available on pin 2 is referenced to ground in (Gi).

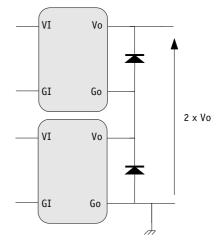

#### 14-3 Connection of Modules in Series

The output of single output units can be connected in series without any precautions to provide higher output voltage level.

Nevertheless, GAIA Converter recommends to protect each individual output by a low power shottky diode rated with the maximum current of the converter to avoid reverse polarity at any output.

Reverse polarity may occur at start up if the output voltages do not rise at the same time.

## **15- PCB Mounting Specifications**

The MGDI-100 series has been designed for on board mounting only. It is recommended not to lay-out any component under the module.

5

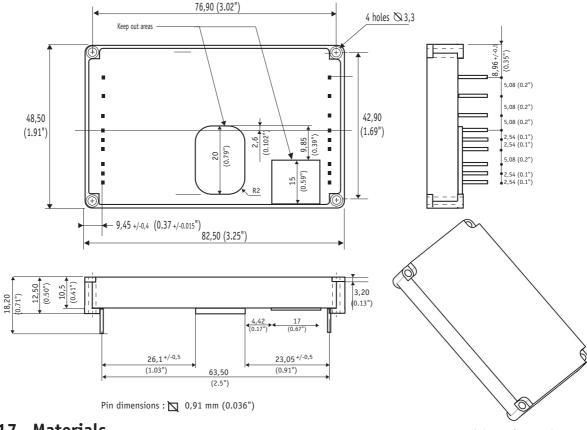

#### **16- Dimensions**

Dimension are given in mm (inches). Tolerance : +/- 0.2 mm (+/- 0.01 ") unless otherwise indicated. Weight : 65 grams (2.30 Ozs) max.

## 17- Materials

Recommended screw for mounting : M2.5

Industrial

Grade

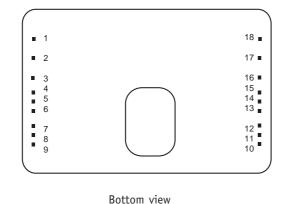

Case : Metallic black anodized coating.

Pins : Plated with pure matte tin over nickel underplate.

# **18- Product Marking**

Upper face : Company logo, location of manufacturing. Side face : Module reference, option, date code : year and week of manufacturing.

## **19- Connections**

| Single         |  |  |
|----------------|--|--|
| 0n / 0ff       |  |  |
